

# Are SUNFLY photovoltaic panels afraid of lightning

Lightning is the number one cause of catastrophic failures in solar electric systems and components. The first major reason is that many PV systems are poorly grounded and poorly protected.

Solar panels do not actively attract lightning strikes, as they are not lightning rods, and their height and metal components do not significantly increase the likelihood of a direct strike.

? Important clarification: Solar panels do not attract lightning or increase strike probability. However, like all elevated electrical equipment, they can be affected when lightning activity occurs in the area.

The chance of a homeowner's property getting struck by lightning is unaffected by the installation of solar panels. Your solar panels will be safer from lightning with the proper protection systems, which could ...

While solar installations don't actively attract lightning like some high-tech lightning rod, their presence does create unique considerations for lightning protection.

Although it is not common for lightning to strike solar panels, it is still possible for solar panels to be struck by lightning. All of us should be careful to ...

PV System Without Lightning Protection. PV systems without lightning protection systems are at extremely high risk, easily suffering damage from lightning strikes and voltage surges. ...

One of the most frequently asked questions about solar systems is whether the panels attract lightning strikes. The short answer is: No, solar panels do not attract lightning.

Although it is not common for lightning to strike solar panels, it is still possible for solar panels to be struck by lightning. All of us should be careful to consider the probability of solar panels being struck by ...

Solar panel systems do not attract lightning, but they can certainly intercept it, particularly when installed on a structure that is already a high point in the surrounding environment.

No, solar panels do not attract lightning. Ebong said solar panels absorb sunlight which then, in turn, can create energy. "A majority of a solar cell is made from silicon," Ebong said. "It...
