

How big is the home solar inverter

What is a solar inverter size?

When we talk about solar inverter size, we're referring to the inverter's rated power output capacity, typically measured in kilowatts (kW). In simple terms, it tells you how much electrical power your solar inverter can handle and convert from DC (direct current) to AC (alternating current) at any given time.

Why is the size of a solar inverter important?

The size of a solar inverter is crucial because it determines how much energy can flow to your home and battery at any given time. More specifically, the inverter ensures that enough energy can flow from your solar panels to the grid and load or if installed with a battery, from and to the battery.

How do I choose a solar inverter?

Knowing your array size allows you to choose an inverter that can handle that production efficiently--without over- or under-investing in capacity. The second step is understanding your system's DC-to-AC ratio, one of the most important metrics when sizing a solar inverter.

What size inverter do I Need?

Most setups run fine with an inverter that's 80% to 120% of the system size. So if you've got a 5kW array, you can go with anything from 4kW to 6kW. Why undersize? Sometimes, it's cheaper and more efficient if you don't need full output all the time. Why oversize? If you're planning to add panels later, it's a smart move.
