

Net metering is an arrangement between solar energy system owners and utilities in which the system owners are compensated for any solar power generation that is exported to the electricity grid.

This paper used the integrated ANP-Entropy model to evaluate the implementation effects of China's Feed-in Tariff Policy of Solar PV Power Generation from the three dimensions of ...

On this basis, this paper proposes an integrated ANP-Entropy model to evaluate the FIT policy of China in three dimensions: environmental, energy, and economic (3E).

This paper proposes a tripartite evolutionary game model, which considers the government, investment enterprises, and residents as the main agents and examines how their ...

The present study is based on Urumqi, along with TAM theory, and selects four types of policies to test the promotion effect of heterogeneous rooftop PV promotion policies in Urumqi. This ...

To boost the development of this industry, a series of policy measures were introduced in 2009 to promote the application of photovoltaic power generation in the Chinese market, with many ...

Photovoltaic inverter sales promotion model Can sales and installation companies enhance solar photovoltaic adoption?

In this paper, considering the effect of factors such as subsidies and countywide promotion policy of photovoltaics, a forecasting model for the development tendency of regionally ...

A mathematical model was used for analyzing the power promotion by integrating local solar irradiance, air pollution levels, and weather conditions. A comparison of the ATS material and ...

Solar Photovoltaic Power Generation Promotion Model
